Tools & Technologies

About me

Site Reliability Engineer with 5+ years of experience in IT industry. I enjoy developing applications that solve problems I am struggling with, so every project I build has its purpose. I am passionate **tech enthusiast** and **developer** building, experimenting, and learning through hands-on home lab setups and cutting-edge technology projects.

Work Experience

Site Reliability Engineer 🌐 [NordSecurity](#)

July 2025 - Present

As co-owner of the end-to-end ETL analytics and visualization platform for application events, I manage the full-lifecycle infrastructure on Hetzner bare-metal and cloud instances using Ansible. I ensure the high availability and performance of a massive data ecosystem that includes self-managed Kafka, Apache Spark, MinIO, Airflow, Tableau, and Docker Swarm. Additionally, I maintain our core networking, load balancing, and observability stack leveraging HAProxy, custom DNS, Zabbix, Prometheus, and Grafana to guarantee system reliability.

I specialize self-service infrastructure, leading the deployment of Kafka Connect to stream data directly into OpenSearch and eliminate analytical bottlenecks for developer teams. To manage this growing environment, I developed a Python-based container application that automates OpenSearch storage lifecycle management. Using a GitOps approach via GitLab CI/CD and AWX, this tool empowers developers to dynamically define index storage quotas, validating capacity allocations during Merge Request pipelines and running scheduled pruning to enforce multi-tenant cluster limits.

Site Reliability Engineer Relativity

December 2023 - June 2025

I am responsible for RelativityOne (e-discovery product) availability monitoring, which is based on NewRelic Scripted Browser monitor running JavaScript Selenium test to verify whether core product functionalities are available for end users.

I specialize in designing, developing, and maintaining automated releases and deployment processes using custom-built GitHub Actions workflows. My role involves ensuring seamless and efficient deployment processes across all cloud-hosted tenants. I work with both Python and PowerShell scripts to programmatically perform operations needed to achieve the goal. As a result I have implemented Selenium test versioning and the ability to easily upgrade or rollback our availability test on production instances.

Operations Specialist Bosch

August 2023 - November 2023

I am developing PowerShell automation scripts which are triggered on monitoring host via Windows Task Scheduler to cover repetitive daily tasks. Usually automation scripts are integrated with SPLUNK alerting system to process data generated by PowerShell and notify operations team about captured issues or coming manual duties.

Technical Engineer Atos

July 2021 - July 2023

I am designing and building automations for as many repetitive tasks as possible using PowerShell scripting. To be able to achieve the goal I have developed many PowerShell modules related to necessary data transformations, which are required in every report or dataset processed. I take care of code speed execution, as well as the optimization of my device resource consumption. Understanding of general concept of multithreading and multiprocessing accordingly with PowerShell available techniques allowed me to speed up operations done within the script and make a better use of computer resources. As a result I capable of delivering very complex reports everyday, on customer's order, where combining data from different tools is required.

IT Network Administrator, Freelance

June 2019 - June 2021

I design, build and modernize complete IT infrastructure. I am responsible for both software and hardware in environments up to 50 users.

During my daily work I cover following areas:

- Network physical and logical topology design, configuration and management - Cisco hardware as well as virtualized solutions like pfSense routing software
- Active Directory domains design, configuration and management
- Storage and backup solutions design, configuration and management
- Virtualization solutions design, configuration and management mainly based on Microsoft Hyper-V
- Device monitoring and remote access design, configuration and management

Projects

Omada Exporter

Custom Prometheus exporter in Go to provide real-time observability for TP-Link Omada SDN infrastructure. Engineered the application to dynamically scrape metrics via Omada's OpenAPI and Web API, optimized for on-demand performance. Designed complementary Grafana dashboards to visualize critical network health data, including router, switch, and access point performance metrics.

Helm Charts

Custom Helm charts optimized exclusively for single-node Kubernetes environments. Engineered to eliminate heavy multi-node replication overhead, maximizing resource efficiency and performance on standalone nodes. Preserves production-grade configurations, security practices, and storage patterns for stateful applications like CloudNativePG, fully integrated with GitOps automation.

Investment

The Investment project is a **Python** based, **containerized** tool designed to automate and streamline the management and analysis of investment portfolios. At its core, the project provides robust functionality for handling investment configurations and updating fund quotations, ensuring that financial data is consistently up-to-date and accurate. Users can quickly configure investments, retrieve and update quotations, and visualize the results on Grafana dashboards. One application instance can handle many investment owners with multiple investment wallets for each owner.

[HornaHomeLab](#) - GitHub Organization

It's Github organization dedicated mostly for Infrastructure as a Code and automations, that I'm running in my Lab environment.

- **HomeLab Setup & Networking:** Automating home networks, routers, firewalls, and servers.
- **Virtualization & Containers:** Building and managing virtual machines and container environments like Docker.
- **On-Premise Infrastructure & Automation:** Leveraging self hosted platforms and deploying infrastructure as code.
- **DevOps & CI/CD Pipelines:** Automating software development lifecycle with continuous integration and delivery.
- **Observability & Monitoring:** Developing custom Prometheus exporters, enhancing observability across infrastructures.

Education

Engineer's degree, Information Technology - Software engineering

[Lodz University of Technology](#)

2021 - 2025

- 2024/2025 - Scholarship from the Rector of the Lodz University of Technology
- 2023/2024 - Scholarship from the Rector of the Lodz University of Technology

ICT Technician

Jan Szczepanik's Technical School No. 10 in Lodz

2017 - 2021

- European Union scholarship "Professionals in the Lodz province" - scholarships for the most talented

Languages

- English: Fluent
- Polish: Native
